- Data Linked Tables: fixed issue when using the Order by configuration item

FARMS

4.5 SP1 QP0

New Feature

- Ohio now has a CRP feature.

4.5 SP0 QP3

Fixed

Overlay

- Changed the area value to be computed from SHAPE_AREA instead of Shape@Area due to an ESRI bug; Shape@Area gave incorrect values for polygons with zero area.
- Revised Overlay to always run Repair Geometry on the final overlay feature class (completedOverlay). Removed the user's option to skip running this final Repair Geometry.
- Added a check for an invalid scratch.gdb geodatabase. FARMS will now give a message and exit if the scratch.gdb is invalid.

Reports

- Restored Thomson-Reuters report for Indiana
- Added code to avoid an error message when running the map report with an empty modifier class. This generally affects North Dakota.
- Revised several of the export reports. in several

cases there was a missing delimiter so midslope and alternate parcels were getting combined.

- For Iowa, removed the Taxable Average CSR values from the Final Calculation Report, since it was not being computed correctly.
- Revised the erosion code calculations for a number of reports.
- Improved the performance in creating the Landuse summary report.

Calculations

- Revised the Area Distribution calculations to improve FARMS performance
- Revised the drainage tax calculation to avoid small positive drainage tax values due to rounding.

General

- Modified the code to list parcel numbers based on the user selected From/To dates. FROM is now based on the beginning of the selected date, and TO is based on the end of the selected date.
- Revised a number of messages to be in standard format.

4.5 SP0 QP2

Fixed

- Allows parcel glyph to be read from Farms so it can differ from Parcel Administrator

4.5 SP0 QP1

Fixed

- Iowa: if configured to use drainage tax & debase value is positive it adjusts to 0
